

GLOW

effective solutions for nail stylists

The **GLOW** brand is professional lighting that improves the performance of services both in beauty salons and medical offices. It offers a wide range of specialized lamps, including UV and treatment lamps, necessary for precise work.

effective device

*smart functionalities
make the lamp will prove
itself both in the salon,
as well as in home use*

Convenient way to have beautiful nails

The **Glow YC57 nail lamp** is a practical device that allows you to **effectively perform manicure and pedicure treatments** using hybrid nail polishes, gels or other light-curing preparations. Practical functions, evenly distributed diodes and the innovative Dual Led technology **guarantee perfect fixation of nail styling**. The original design, ease of use and well-thought-out functionalities make the lamp **perfect for both professional and home use**.

57 diodes

dual led technology

—
evenly distributed LEDs allow for adequate curing manicure

Shadowless device with Dual LED technology

Equipped with **57 properly placed LEDs** (without the so-called “dead zone”), it ensures perfect curing of gels and hybrid nail polishes. **The closed shape, the so-called booth** allows for more precise and faster fixation of nail designs. **The Dual Led technology** used makes the diodes emit light of two wavelengths – 365 nm and 405 nm. As a result, it does not cause excessive eye strain and **provides a wide spectrum of action**. These solutions ensure **proper hardening of even the most demanding products**, reaching even the more inaccessible places on the nail plate.

display with timer

allows you to set one of three operating times: 30 s, 60 s and 99 s (Low Heat Mode)

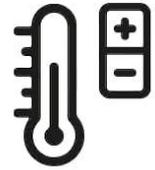

Adjusting the working time to individual needs

The lamp is equipped with a **timer with four programmed operating times**: 10 s, 30 s, 60 s and 99 s (so-called “Low Heat Mode”), which are counted down on the digital display. Additionally, if no mode is selected, **the built-in motion sensor** will automatically turn on the lamp when you put your fingers or toes under it, assuming a maximum exposure time of 120 seconds. The display will then show the curing time. This allows you **to conveniently select the length of exposure** to suit the styling being performed at a given moment and the user's needs.

low heat mode

the device gradually increases its power, eliminating the burning sensation

Comfortable “Low Heat Mode”

The already mentioned “Low Heat Mode” system causes the lamp to **gradually increase its power** during styling curing, thus heating up slower. **This minimizes the sensation of burning or heat** during exposure. This function is **irreplaceable, especially when hardening gels**, which often causes discomfort when using other lamps available on the market.

ergonomic bottom panel

removable bottom facilitates pedicure treatments and will be useful for cleaning the device

Detachable bottom panel and elegant handle

Features an **easy-to-remove bottom** in shades of white. This makes it **much easier to place the foot under the lamp** during pedicure or podiatry treatments. This option is also **perfect for cleaning or disinfecting the device**. The handle in shades of chrome with a polished finish is a visually appealing addition that makes it easier to transport the device and **will work well for mobile stylists**. There is also a special recess on the case that can be used as a **stand for the phone**. It allows you to enjoy the duration of the treatment with your favourite movie.

Elegant design and functionality

The well-thought-out functions, interesting shape and decorative embossing make the lamp a practical yet tasteful element of the equipment of a nail salon. The appropriate size **allows you to place the entire hand or foot under the lamp**, which ensures even hardening of the styling, thereby reducing the risk of allergies. The technological solutions used make it a product worth considering **both for professionals in the beauty industry and for home users**.
